

Abstract

Methods, computer programming, systems and devices that enable an office purchaser or a homeowner to regularly reorder supplies using a profile established on an administrator's website servers. Using a personalized list of supplies to place orders, a client identifies needed items by (a) scanning an appropriate barcode on a personalized list, (b) calling up and marking a profiled list maintained at the administrators website and/or adding or subtracting items using keyboard or mouse. The software installed on a client's computer runs silently as background as other programs are executed, but comes forward when a barcode is scanned or another input summons the program.
